

# POWDERCOAT CORE RANGE

## Finish Description

---

Powder coating is a durable finishing process where a dry powder is electrostatically applied to metal, then cured under heat to form a protective layer. The surface is first cleaned and pre-treated for adhesion, then coated with powder using an electrostatic charge. The item is then baked, melting the powder into a smooth, long-lasting finish.

## Care and Maintenance

---

- To protect your hardware, we suggest cleaning the surface periodically with a warm soapy lightly dampened cloth to remove any build-up of dust and grime that may cause corrosion and affect the integrity of the finish. Then simply dry thoroughly with a clean, soft cloth.
- Atmospheric conditions, salt deposits, acids, caustic agents, cement or dust on construction sites all have the potential to cause discolouration to the surface. Minimum of monthly cleaning of door handles is recommended for both finish preservation and general hygiene.
- Please avoid using any metal polishes, abrasive cleaners, scorers or rough cloths that may damage or scratch the hardware and do not spray or immerse the hardware in liquid to clean.
